

CYCHLORPHINE

(Synthetic “Orphine” Opioid)

WHAT IS IT?

Cychlorphine is a synthetic “orphine” opioid that has been found in fake pharmaceutical samples, such as hydromorphone (Dilaudid), oxycodone (OxyContin), and Percocet. It is not approved for pharmaceutical use.

POTENCY

Its potency is still unknown; however, similar orphine opioids are considered to be just as strong, if not stronger, than fentanyl.

WHAT WILL IT DO?

Cychlorphine is presumed to act as an opioid. Its effects and potential side effects likely resemble those of other potent opioids, such as fentanyl, which typically include euphoria, sedation, dizziness, shallow breathing, and nausea.

CAN I OVERDOSE ON CYCHLORPHINE?

YES! Cychlorphine is a synthetic opioid that can cause overdose. Since its strength is unknown, the risk of overdose may be increased. Use Naloxone and call 911 if you suspect an overdose.

SIGNS & SYMPTOMS OF AN OVERDOSE

- Slowed down or no breathing
- Bluish lips and fingernails
- Pinpoint pupils
- Cold, clammy skin

TIPS

- Get your drugs tested
- Start with a small amount
- Don't use alone
- Carry Naloxone
- Download the LifeguardConnect App
